

DIP Arena Usage Guide

How to use the free local query interface step by step

This guide explains how to run the local DIP Arena project, enter a query, review the decision report, export results, and compare saved reports. No API key is required.

1. Start the web app

Open a terminal in the project folder and run the local server:

```
C:/Python314/python.exe dip_web_server.py --port 8000
```

Then open **http://127.0.0.1:8000** in your browser.

2. Fill in the query form

Use the left panel to define the decision you want analyzed.

- Query: type the question you want DIP to analyze.
- Domain: choose the closest category, such as policy, healthcare, business, research, or security.
- Stakes: choose low, medium, or high.
- Constraint: add a key rule such as must remain auditable.
- Notes: add any extra context that may help the deliberation.

3. Load the sample if you want a quick demo

Click **Load Sample** to prefill a ready-made policy example. You can then submit it as-is or edit the fields first.

4. Analyze the query

- Click **Analyze Query** to send the request to the free local DIP engine.
- The system routes the query to specialist agents.
- It then creates a debate, critiques the strongest claims, validates the reasoning, and synthesizes a final report.

5. Read the decision report

- Recommendation: the final suggested action.
- Confidence: how certain the system is about the recommendation.
- Risks and tradeoffs: the main caveats and decision tensions.
- Agent debate: the individual specialist agent viewpoints.
- Validation matrix: how the claims were checked against built-in evidence.

6. Export the report

After an analysis completes, use the export buttons at the top of the report panel.

- Export JSON saves the full structured report as a .json file.
- Export Markdown saves a readable .md version of the report.

7. Save and revisit history

Each analysis is stored locally in your browser. You can click a history item later to reload that report without re-running the query.

8. Compare two saved reports

- Open the Compare Reports section near the bottom of the page.
- Pick any two saved queries from the dropdowns.
- Click **Compare Selected** to view the confidence gap, recommendation difference, and risk difference.

9. Switch themes

Use the Theme button in the hero card to switch between the presentation palette and a midnight mode.

10. Run the CLI version if needed

You can also use the terminal-only workflow:

```
C:/Python314/python.exe -m dip_free "your question" --domain policy --free --save-report
```

Tip: the browser app is the easiest way to explore DIP, while the CLI is useful for quick batch runs and saved JSON reports.
